AI PLACEMENT ANALYZER

Why This Project Is Needed • B.Tech CSE (AIML)

Project purpose: The AI Placement Analyzer is a web application that compares a student's resume with a job description, identifies matched and missing skills, estimates a transparent compatibility score, and recommends ways to prepare for placements.

Why Is This Project Needed?

NEED	HOW IT HELPS
1. Find skill gaps	Shows which required skills a student has and which skills (for example, SQL or model deployment) need improvement.
2. Match job requirements	Compares a resume with a job description so students can judge how closely their profile fits a role.
3. Guide preparation	Suggests skills, projects, and topics to learn first instead of leaving students unsure where to start.
4. Improve resumes	Gives specific feedback on relevant skills and missing information rather than only saying a resume is good or bad.

Example of the Output

Illustrative resume–job match score	**72%**
Matched skills	Python • Machine Learning • NumPy
Skills to improve	SQL • Deep Learning • Model Deployment

The 72% score is only an example. The actual application calculates a score from the resume, job description, and selected matching method.

Why Use AI Instead of Manual Checking?

Manual checking	AI Placement Analyzer
Read and compare job requirements one by one.	Extracts and compares skills automatically using NLP and matching methods.
Difficult to compare profiles consistently.	Uses a defined scoring method and shows the result clearly.
May not know what to learn next.	Recommends missing skills and learning priorities.

Who Benefits and Technologies Used

Beneficiaries: B.Tech students, freshers, college placement cells, and career counselors. **Possible technologies:** Python, NLP, semantic embeddings, Flask/FastAPI, SQL/MySQL, and HTML/CSS/JavaScript.

Project value: Resume analyzers already exist, so the project can stand out by explaining its score, showing evidence for matched/missing skills, and providing a personalized learning roadmap.
